Professional Summary

Data Science graduate with expertise in SQL, Python, and analytics, specializing in churn prediction, funnel optimization, and automated anomaly detection. Proven ability to translate complex data into actionable business insights, flagging HIGH-risk accounts churning at 50%, more than 3x the MEDIUM-risk rate and cutting root-cause analysis time from hours to zero. Seeking opportunities in data analytics, business intelligence, or product analytics roles.

Education

Stevens Institute of Technology, Hoboken, NJ

Master of Science in Data Science, GPA: 3.56/4

Aug 2024 – May 2026

Relevant Coursework: Web Mining, Marketing Analytics, Statistical Methods, Applied Machine Learning

Savitribai Phule Pune University, Pune, India

Bachelor of Engineering in Artificial Intelligence and Data Science, GPA: 8.3/10

Aug 2020 – May 2024

Skills

SQL: PostgreSQL, MySQL, Snowflake (joins, CTEs, window functions, subqueries, aggregations)

Python: Pandas, NumPy, Matplotlib, Seaborn, Scikit-learn, SciPy, BeautifulSoup

Analytics: Exploratory Data Analysis (EDA), Funnel Analysis, Cohort & Retention Analysis, KPI Design, A/B Testing, Statistical Analysis

Reporting: Tableau, Power BI, Microsoft Excel (pivot tables, VLOOKUP, financial modeling), Google Sheets

Tools: Jupyter Notebook, dbt, Git/GitHub, Microsoft PowerPoint, AI Tools (ChatGPT, n8n, Claude, Gemini)

Project Experience

SaaS Retention, Churn and Early Warning Analytics

Role: Data Analytics Lead | Tools: Cohort Analysis, KPI Layer, Tableau

- Validated risk-band scoring against actual churn across 500 accounts: HIGH-risk accounts churned at 50% versus 15% (MEDIUM) and 7% (LOW), driven primarily by usage drop and high error rate
- Identified the first 90 days as the primary churn lever via cohort retention (M1: 90.1%, M3: 76.5%, M6: 57.4%), pointing retention strategy toward onboarding fixes over long-term engagement
- Quantified \$9.9M total paid MRR against an 8.02% weighted churn rate (34 of 482 accounts churned), isolating Enterprise tier and the 21 to 50 seat bucket (\$165K churned MRR, the highest of any range) as the churn concentration point

E-commerce Funnel Analysis

Role: E-commerce Data Analyst | Tools: PostgreSQL, Tableau, Funnel Analysis

- Diagnosed revenue leakage across a 1.76M-session funnel, building a session-level clickstream mart in PostgreSQL (sessionization, timestamp cleaning, window functions) for stage-by-stage conversion tracking
- Pinpointed the primary leak at View to Cart (2.21% conversion, a 97.79% drop) rather than checkout (27.17% Cart to Purchase), shifting optimization priority to the product-page and add-to-cart experience
- Found returning visitors converted at nearly 3x the rate of new visitors during peak hours, informing 3 A/B tests (PDP clarity, category UX, cart recovery) packaged into a stakeholder memo and 4 Tableau dashboards

GMV Anomaly Detection & Revenue Driver Attribution System

Role: Data Analyst | Tools: Python, PostgreSQL, Claude API, Statistics

- Reduced time-to-root-cause from hours to zero by engineering a pipeline that detects, decomposes, and narrates GMV anomalies automatically, surfacing 12 flagged revenue events across 18 months with severity tagging and driver attribution
- Improved detection robustness over standard deviation by applying MAD-based robust z-scores on detrended residuals; validated against 3 synthetic stress-test shocks, all detected cleanly
- Eliminated analyst write-up time by constraining an LLM to pre-computed fact packets only, producing auditable What/Why/Action briefs; a Black Friday spike of +558% (z=29.79) was attributed to Southeast Brazil at 72% of total delta with no manual query

Professional Experience

Stevens Institute of Technology, Hoboken, NJ

Graduate Peer Leader

Aug 2025 – May 2026

- Mentored incoming graduate students through academic and professional transitions, providing structured guidance on goal setting, coursework, and resources throughout the semester

Exposys Data Labs, Maharashtra, India

Data Science Intern

2023

- Resolved missing values and engineered derived features across a 768-patient, 8-variable clinical dataset (glucose, BMI, insulin), preparing the data for predictor and risk analysis
- Determined glucose, BMI, and age as the strongest predictors of diabetes risk through variable contribution analysis, translating findings into stakeholder-ready visualizations of risk factor patterns and segment-level breakdowns

Key Achievements

- Validated risk-band scoring that flagged HIGH-risk accounts churning at 50%, more than 3x the MEDIUM-risk rate
- Surfaced \$165K in churned MRR concentration, enabling targeted retention strategies for Enterprise tier
- Cut root-cause analysis time from hours to zero with automated GMV anomaly-flagging pipeline
- Drove 3x conversion improvement for returning visitors through data-informed A/B testing recommendations
